©On the basis of the execution of the best service and product innovation, GMT hereby would have this declaration of retaining the right for engineering change. If any drawings or articles revised and added in the catalogs, there would be no extra further notice. To get most up-to-day information, please contact our agent or sales while necessary.

### ◆ **GMT XY-TABLE** divided into :

◎ Precise level(P) : Ball screw shaft is C5 level, linear slide block is precise level (heavy preload).

Application : Measure device, instrument, painting equipment.

◎ Regular level(R) : Ball screw shaft is R level, linear slide block is high level H (light preload).

Application : Woodworking machine、Cutting machine、LCR carving machine、Video Comparactor.

### ◆ Perfect durability

**GMT** linear Slide table base is made by high strength aluminum alloy, has been stress eliminated and cryogenic treatment under 196°C (Please refer to P.42), such quality may maintain high precision still after long period using. while it is applied to the slide table required high precision, the base structure is stable enough to against distortion such as expansion while thermal and shrink while cool caused by the environment variation, also can keep a consistent movement of the slide table set. Thus, the base material durability has been highly increased to take the maximum deforming.

### ◆ Variety of dimensions assembly

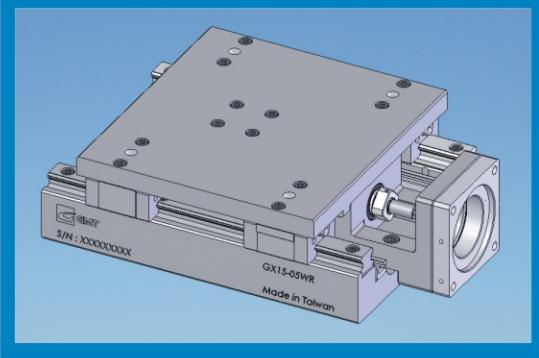

XY-TABLE dimensions, from 150mm ~ 400mm, travel stroke from 50mm ~ 500mm, modularized design creates variety of single axis or dual axes models, fit for linear moulds used in Automatic, Photo-electric, and Semi-conduct fields.

### ◆ Motor base

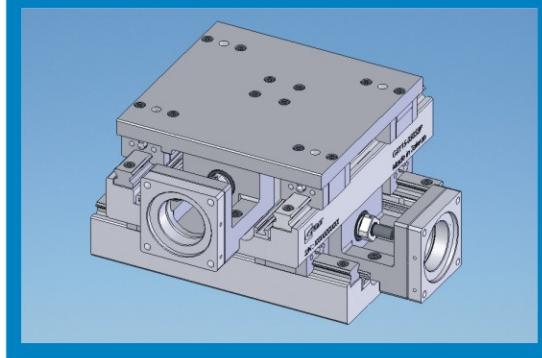

Matched with all servo motors, easy insert installation without axis adjustment.

★ Motors, couplings are excluded from **GMT XY-TABLE** units.

Single axis: GX

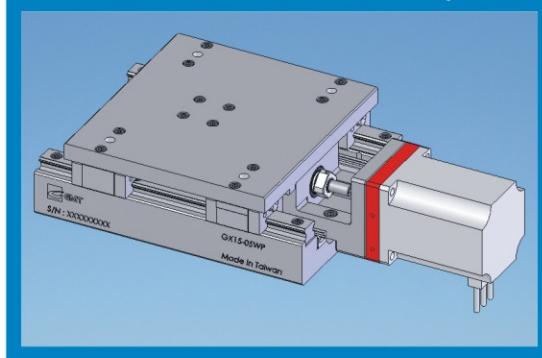

Dual axes: GXY

With dust cover: GX-J

Motor connection examples:

- (1) Choose precise level(P) or regular level(R) by working environment and accuracy requirement.
- (2) Select Single axis or Dual axes.
- (3) Required table dimensions.
- (4) Stroke options.
- (5) Function options : with dust cover(J)、No dust cover.
- (6) Surface finish : Anodizing - Primary color or Black color.
- (7) Coupling added or not( optional accessory)
- (8) Please advise motor brand, model no. while ordering.  
(to match with motor connection)

### ◆ Lubricant use

#### • General environment :

Linear rail : Lithium soap lubricant NO. 2 or lubricant in viscosity 30~150cst.

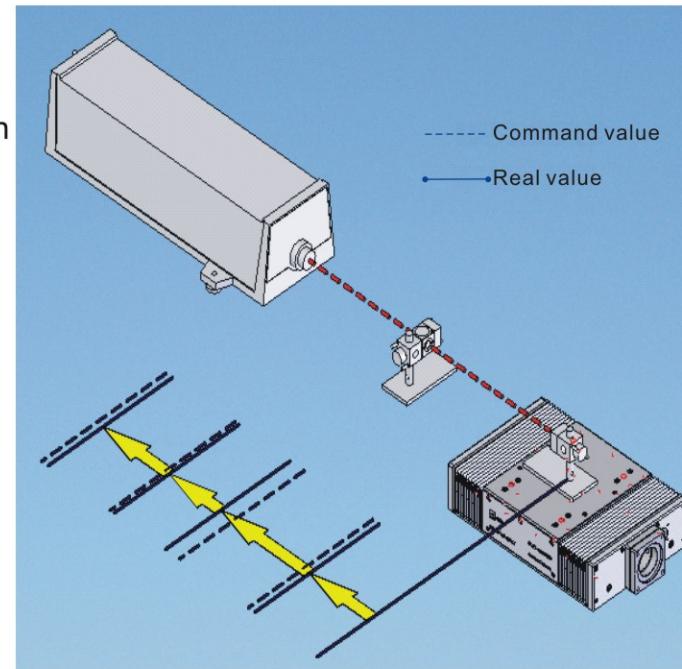

Ball screw shaft : Lithium soap lubricant or lubricant in viscosity 30~40cst.

#### • Clean room :

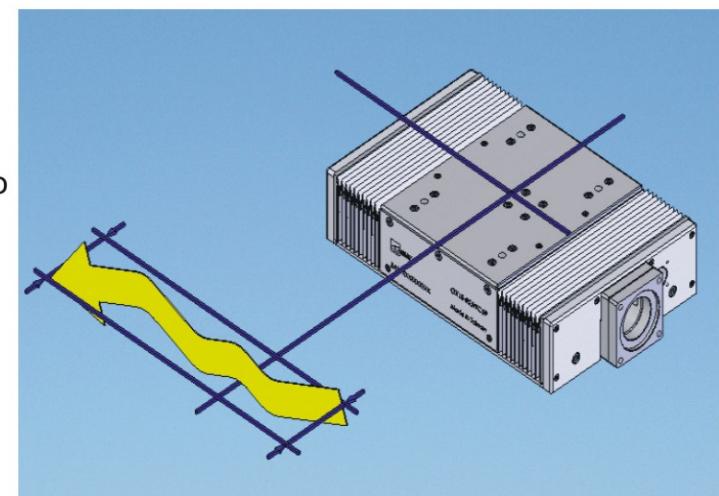

Lubrication level depends on individual request from clean rooms.

**Accumulated read error(Positioning Accuracy) (Refer to JIS B 6191-1999)**

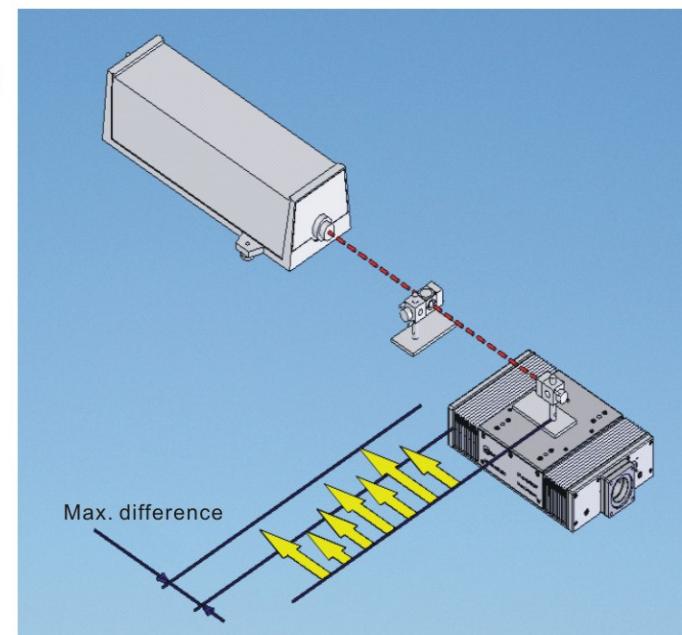

From datum, move in direction, same interval positioning gradually in the range table could move and note down each real position value (measured from datum to the stop point), and command value( the expected value position in theory after commanding). The maximum difference is called Accumulated reading error. (Positioning Accuracy)  
This could be revised by controller.

**Straightness (XY axis direction ) (refer to JIS B 6191-1999)**

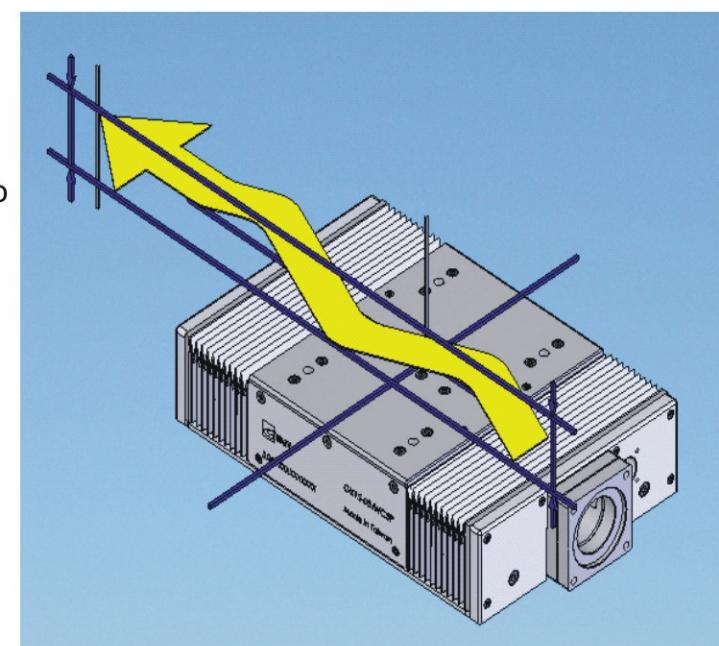

Positioning on the table(with Glass Ruler...etc) as the datum, and measuring by electric gauge in the range table could move. Connect two spots from starting point of test to destination, and the maximum difference between two points is called Straight value. It includes vertical part and parallel part. Each of maximum value is Straight value of table.

**Repeated Accuracy ( refer to JIS B 6191-1999)**

Any point begins in same direction ( As datum) Take 7 times measurement to get max. difference. This operates in center and two ends, and have the Plus/Minus value after measured maximum difference divided by 2, called Repeated positioning accuracy.

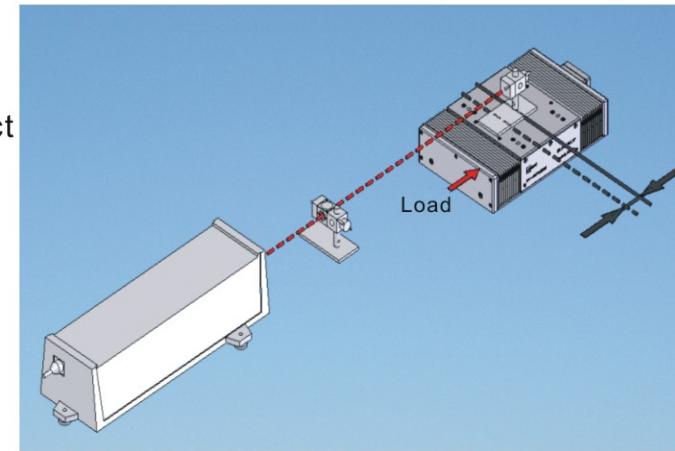

**Straightness(Z axis direction) (refer to JIS B 6191-1999)**

Positioning on the table(with Glass Ruler...etc) as the datum, and measuring by electric gauge in the range table could move. Connect two spots from starting point of test to destination, and the maximum difference between two points is called Straight value. It includes vertical part and parallel part. Each of maximum value is Straight value of table.

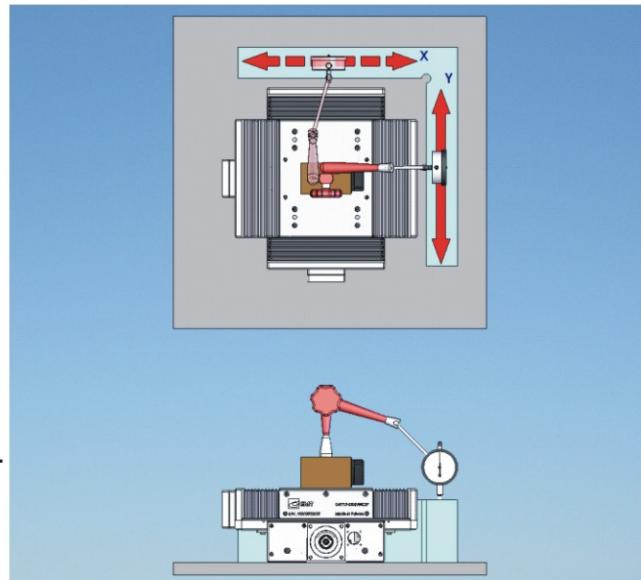

**Backlash clearance** (refer to JIS B 6201-1976・4-22)

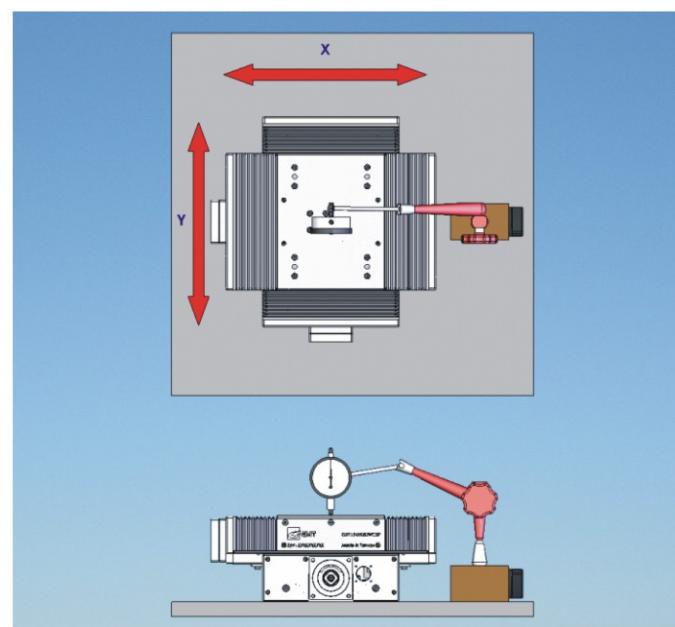

Use gravity of table or center in moving range as datum, and put a specified load on it in the same transmission direct as moving forward to datum. Difference between basis and unloaded position after unloading is called Backlash clearance.

**Parallel value B in XY action** (refer to JIS B 6201-1976・7-52)

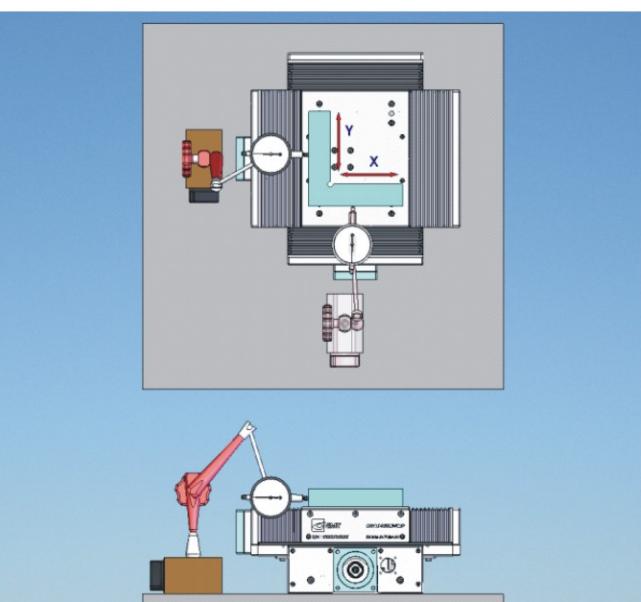

Parallel value comes from XY act and plane(XY positioning table intallation plane). (Gauge fixed and immovable) Fix gauge in the center of table stroke, and have sticks of gauge against installation plane of table. Test the table in full stroke of moving in X direction and Y direction, and take difference of maximum in moved distances as test value.

**Parallel value A in XY action** (refer to JIS B 6201-1976・7-51)

Parallel value comes from XY act and plane(XY positioning table intallation plane). (Gauge fixed and immovable) Fix gauge on installed plane of XY positioning table, and have sticks of gauge against center of table, and test in full stroke of table moving in XY direction. Take maximum difference in moved distances as test value.

**Right angle value in XY action**

Consist in right angle between X axis and Y axis. Use squares fixed as datum, and take gauge to test error value in vertical direction to the datum, maximum in moved distances is test value.

**GMT XY-TABLE** products use limited elements analysis software in application on construction and shape for optimized design.

#### ◆ Points to optimized design are as below :

1. Reduce materials used in parts production, and decrease manufacture and transportation cost at the same time.
2. Due to material reduction, also decrease down entire weight of product greatly ; in opposite, energy loss dropped down by product weight decrease, but system efficiency raised. Meanwhile environment protection is also reached.
3. Decrease stress , increase construction strength.
4. Shape optimized design reduces material use, and improves the appearance of product, smooth and streamlined as well.
- 5.Optimized design could save a lot of time in the design process by automatic analysis software execution and programmable parameter, without large amount of manpower to shorten the development duration.

#### ◆ Five basic steps in optimized design :

##### 1.Initial design parameter

Before use Variable initialed into a design parameter, it needs to be appointed in the beginning before pre-work, so that it could avoid design parameter to be initialed again.

##### 2.Definition

Main job of pre-work is producing limited element model required by optimized analysis. This is exactly the same as regular analysis.

##### 3.Primary analysis execution

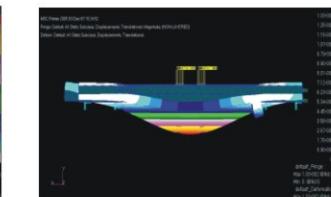

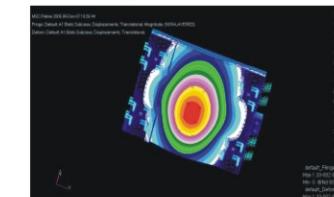

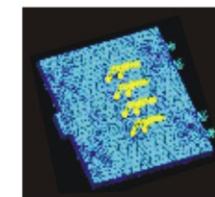

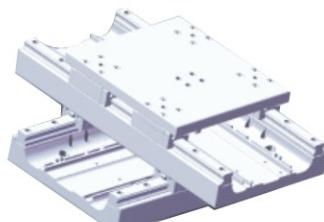

Optimized resolution is the same as regular ANSYS steps, is result in chief, such as stress, strain and distortion...etc.

##### 4.Get feedback

Post-work step is usually used to take required value(ex: stress, strain), and this step is mainly collected and stored with target function and limited condition to parameter type.

##### 5.Target function setting, conditions limitation and loops of optimized execution.

Final step is to optimize analysis process, mainly control of optimized process of design, such as parameter design, limit of maximum and minimum, and declaration about target function and convergence principal.

#### ◆ Product analysis items

- 1.Slide distortioin analysis.
2. Max. load of Dual-axes plane moving to end of X and Y. (Self-load).
3. Max. load of Dual-axes plane moving to end of X and Y. (Side load).
4. Max. capacity of X、Y rails and table.
5. Heat deformation of rails, and table .
6. Mode analysis of rails、table、slide block and slide set.
7. Cosmos and Nastran construction verification.

		Mode 1	Mode 2	Mode 3	Mode 4
	Resonance frequency (Hz)	7 (bending)	9 (torsion)	20 (bending)	24 (torsion)
	Resonance frequency (Hz)	24 (torsion)	35 (bending)	46 (bending)	62 (torsion)
	Resonance frequency (Hz)	271 (torsion)	453 (bending)	506 (bending)	578 (torsion)
	Resonance frequency (Hz)	17 (torsion)	23 (bending)	40 (bending)	41 (torsion)

## Positioning control

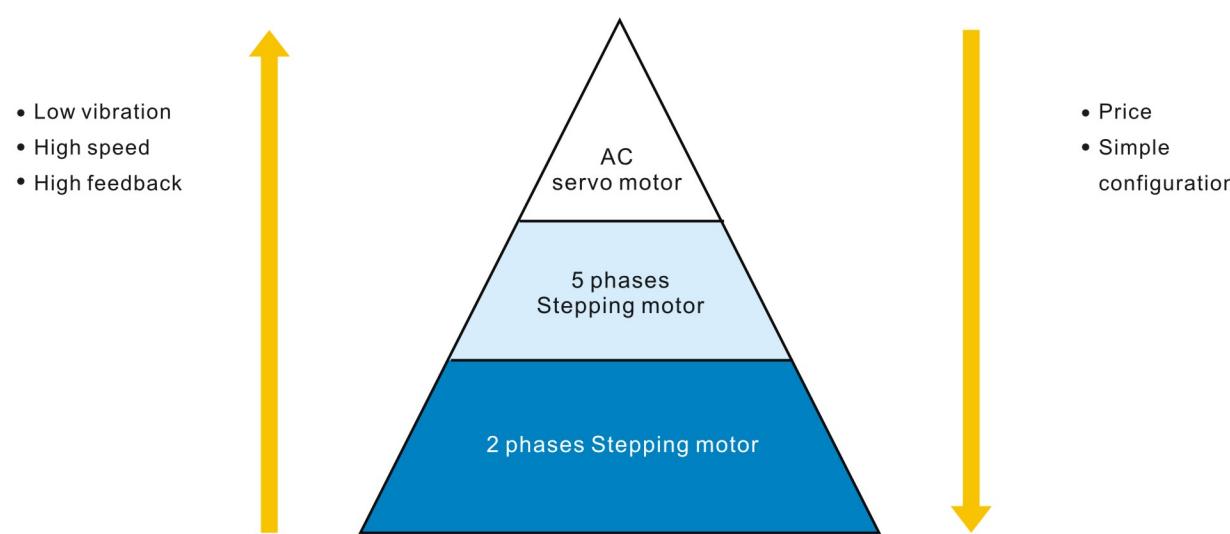

## ◆ Control Mode Comparison

Mode	Component	Advantage	Defect
Open loop	<p>• Speed • Movement</p>	<ul style="list-style-type: none"> <li>Simple configuration</li> <li>Low price</li> </ul>	<ul style="list-style-type: none"> <li>Slip with ease</li> <li>Unusable in max. capacity</li> <li>Positioning accuracy decided by table quality</li> </ul>
Semi-closed loop	<p>(TG: Tachometer E: Decoder)</p>	<ul style="list-style-type: none"> <li>High speed feedback</li> <li>Usable in max. capacity</li> </ul>	<ul style="list-style-type: none"> <li>Higher price</li> <li>Carbon brush life in Motor</li> <li>Positioning accuracy decided by table quality</li> </ul>
Close loop	<p>(Optical linear scale Laser measuring)</p>	<ul style="list-style-type: none"> <li>Precise positioning</li> </ul>	<ul style="list-style-type: none"> <li>Highest price</li> <li>Complicated configuration in servo system, not easy to adjust</li> </ul>

## ◆ Stepping motor and DC servo motor

Stepping motor and DC servo motor are usually used as power source to drive the positioning table. Each one has its feature for selection up on application needs. AC servo motor is also brushless DC motor with similar character as DC servo motor.

Motor	Advantages	Defect
2 phases Stepping motor 1/4000	<ul style="list-style-type: none"> <li>• Cheaper drive circuit</li> <li>• Simple configuration</li> <li>• Resolution (mm)- 1/200, 1/400, 1/800</li> </ul>	<ul style="list-style-type: none"> <li>• Bigger, unbalance torque, needs anti-vibration (especially in low rpm)</li> <li>• Drive in mid, high speed, need proper speed adjustment ( Torque decrease while high speed running&gt;&gt;slip out)</li> <li>• Motor overheating</li> </ul>
5 phases Stepping motor and DC servo motor	<p>Compare to 2 phase motor</p> <ul style="list-style-type: none"> <li>• Rotate smoother</li> <li>• Low vibration</li> <li>• High resolution 1/500 ~ 1/1000</li> <li>• 1/1500 ~ 1/10000</li> <li>• High speed feedback</li> <li>• Low damping character</li> </ul>	<ul style="list-style-type: none"> <li>• Torque decrease while high speed running &gt;&gt;slip out</li> <li>• Motor overheating</li> </ul>
DC servo motor and AC servo motor	<ul style="list-style-type: none"> <li>• Low vibration</li> <li>• High speed , high feedback</li> <li>• Position confirm by decoder, no worry about slip out.</li> <li>• Usable in max. capacity ( Max. torque = couple times to rated torque)</li> <li>• High resolution( resolved by decoder and multiple circuit to 1/1000, 1/2000...)</li> </ul>	<ul style="list-style-type: none"> <li>• Higher price in motor driven circuit</li> <li>• Carbon brush life and abrasion pollution concerned if attached on motor.</li> <li>• Motor overheating needs to be noticed in high speed adjustment and high frequency heavy loading.</li> </ul>

## Discussion of Resolution and Speed

### ◆ Discussion of Resolution

Resolution(the minimum unit) means table movement in each pulse signal( mm/ pulse). In other word, the value acquired by guide stroke of ball screw divided by division of motor revolution. ( in situation without gear)

$$\text{Discussion of Resolution} = \frac{\text{Guide stroke of ball screw shaft}}{\text{Division of motor revolution}}$$

$$(\text{Ex:}) \frac{5\text{mm}}{1000\text{p}} = 0.005\text{mm/pulse}$$

In stepping motor, division of motor revolution is decided by basic division and driver magnetization.

2 phases stepping motor ..... 200, 400 , 800

5 phases stepping motor ..... 500, 1000, 5000, 10000

In semi-closed loop mode( DC motor, AC servo motor), is decided by decoder division and multiple of electricity(1,2,4). 2000 pulse or 4000 pulse is also as option to use, when decoder is 1000 pulse.

In close-loop mode, resolution is nothing with guide stroke, but decided by optiical linear scale(10 μm, 20 μm),and division circuit of electricity.

5 μm/p & 1 μm/pin general, 0.1 μm/pin high resolution.

### ◆ Speed

Top table speed V(mm/s) is decided by max. limited rotation numbers (rpm) and guide stroke of ball screw (mm/rev).

$$\text{Table speed } V = l \times \frac{N}{60} \text{ mm/s}$$

(Ex: )  $l = 10\text{mm/rev}$ , and applied  $N=3,000 \text{ rpm}$  motor.

$$\text{Table speed } V = 10 \times \frac{3000}{60} = 5000\text{mm/s}$$

Comparing to load torque of table, output torque of motor must be in well balance. More caution on using stepping motor in high speed revolution, due to extreme dereasement during torque outputting, especially over 1500 rpm.

Using DC motor or AC servo motor, the max. RPM sometimes would be also affected by wave number of decoder( limited by positioning deviation counter), besides motor function.

(Ex: ) Max. wave no. in deviation = 100 kpps, ball screw  $\ell = 10\text{mm/rev}$ , decoder division P = 1000.

1. Using resolution 0.01 mm/ p

Wave no. in deviation counter f =  $500/0.01 = 50 \text{kpps} < 100 \text{kpps}$ , speed would upto 500mm/sec, whiel N - 3000rpm.

2. 4 times to decoder, equal to 4000 p/rev,  
resolution turned into  $10/4000 = 0.0025 \text{ mm/p}$ ,  
table speed  $V = 100,000 \times 0.0025 \times 250 \text{ mm/sec}$   
motor RPM N =  $250/10 \times 60 = 1500 \text{ rpm}$

### ◆ Motor type with Resolution and Max. speed Comparison list

Motor Models	Division	Max. wave no.	Guide stroke of ball screw shaft ( mm/rev )																
			2		4		5		8		10								
Pulse/rev	Kpps	Reslution (μm)	Top speed (mm/S)	Reslution (μm)	Top speed (mm/S)	Reslution (μm)	Top speed (mm/S)	Reslution (μm)	Top speed (mm/S)	Reslution (μm)	Top speed (mm/S)	Reslution (μm)							
2 phases stepping motor	200	6	10	60	20	120	25	150	40	240	50	300	100						
	400	12	5		10		12.5		20		25		50

5 phases stepping motor	500	20	4	80	8	160	10	200	16	320	20	400	40						
	1000	40	2		4		5		8		10		20						
	5000	200	0.4		0.8		1		1.6		2		4						
	10000	400	0.2		0.4		0.5		0.8		1		2						
DC servo motor ( AC servo motor)	800	40	2.5	100	5	200	6.25	250	10	400	12.5	500	25						
	1000	50	2		4		5		8		10		20						
	2000	100	1		2		2.5		4		5		10						
	4000	200	0.5		1		1.25		2		2.5		5						
Close-loop mode with optical linear scale	Max. wave no.		Resolution				Top speed ( nothing to guide stroke of ball screw )												
	300 kpps		0.1μm				30 mm/S						( Special control system required to raise speed )						
			0.5μm				150 mm/S												
			1.0μm				300 mm/S												

To judge linear rail guide model fit or not by these results.

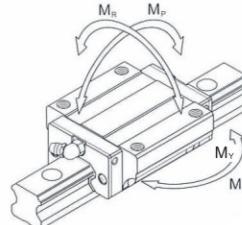

Checking computation of load capacity is to get static safety factor by basic rated static load( $C_o$ ), and also ensure static load limit; checking computation of life is to calculate rated life by basic rated dynamic load. Life of linear rail guide means grand distance accumulated of circulatory stress effect brought from balls or rolling plane till peeling off from metal surface caused by rolling fatigue of material.

### Basic static load $C_o$

The contact area in between balls with rolling plane on linear rail guide would appear partial eternal-distortion while against overload or shock during running in static or low speed. In case of distortion out of limitation would affect smoothness of linear rail motion. Basic rated static load( $C_o$ ), is static load in same direction and equivalence, where max. stress occurring in contact surface have eternal distortion sum between ball and rolling plane reached to 0.0001 times to the ball diameter, also called allowed limit of staticload.

### Allowed static torque $M_o$

While act torque on linear rail guide, the max. stress occurs from balls on two ends of guides, seeing ball stress dispersed on linearl guides. Allowed static torque ( $M_o$ ), is static torque in same direction and equivalence, where max. stress occurring in contact surface appear eternal distortion sum between balls and rolling plane reached to 0.0001 times to the ball diameter, also called allowedlimit of static torque. In linear rail guide, torque is defined as  $M_P$ 、 $M_y$  and  $M_R$ , 3 directions as drawing below.

### Static safety factor $f_s$

While linear rail guides are applied to vibration, shock or intense running stop, due to inertia force or outer torque effects, hard load would occur. Under this load situation, static safety factor is considered necessarily. Static safety factor( $f_s$ ) is shown as mutiples to load which basic rated static load( $C_o$ ) on linear rail guide act onas follow formulas. All datums of static safety factors in various application as below:

$$f_s = \frac{C_o}{P}$$

fs : static safety factor  
 $C_o$  : basic static load(N)  
 or  
 $M_o$  : allowed static torque(N · m)  
 $P$  : calculated load(N)  
 $M$  : calculated torque(N · m)

### Datum of static safety factor

Machine	Load condition	lower limit of fs
General machine	Regular load	1.0 ~ 1.3
	Vibration, shock	2.0 ~ 3.0
Machine tool	Regular load	1.0 ~ 1.5
	Vibration, shock	2.5 ~ 7.0

### Basic dynamic load C

There are a little differences in life of linear rail guides, even same batch of products running in same condition. Therefore, to ensure life of linear rail guide, defined rated life is used as below. Rated life( $L$ ), means total distance of same batch of linear rail guides in same specification run under common conditions, 90% of appearance without peeling off caused by surface fatigue. While linear rail guide runs with load, basic rated dynamic load is required to calculate its life. Basic rated dynamic load(  $C$  ), stands for load of same batch of linear rail guides in same specification running in common condition have rated life, 50km(rolling ball), same direction and equivalent.

### Life calculation

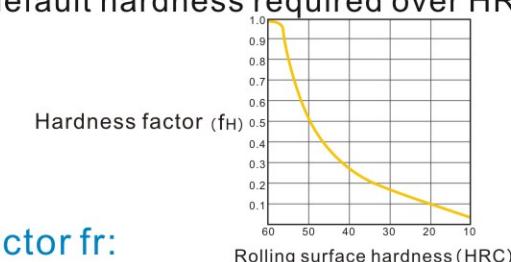

Rated life of linear rail guides depend on actual load. Use basic rated dynamic load( $C$ ), and work load( $P$ ) in optional spec to calculate usage life. Usage life of linear rails change by running situation, plane hardness and surrounding temperature. When rolling stuff is ball, we could use formula as below to calculate life:

$$L = \left\{ \frac{f_H \cdot f_r}{f_w} \times \frac{C}{P} \right\}^3 \times 50$$

L : rated life(km)      fH : hardness factor  
 $C$  : basic dynamic load(N)      fr : temperature factor  
 $P$  : work load(N)      fw : load factor

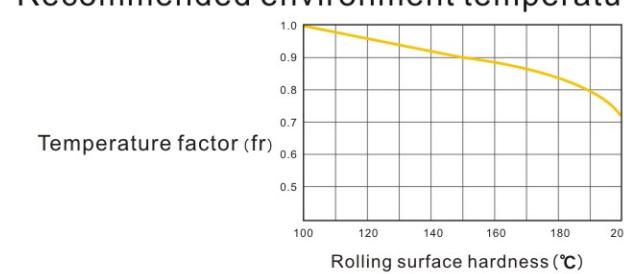

### ◆ Hardness factor $f_H$ :

Hardness of plane where linear rail guide run must be HRC58~64. Load capacity of linear rail guide would decrease if hardness under the range. Basic rated dynamic load and static load shall multiply relative hardness  $f_H$  individually, as chart below. Linear rail guide default hardness required over HRC58, so  $f_H=1.0$

### ◆ Temperature factor $f_r$ :

Life of linear rail guide would be affected by high temperature, especially used in environment over 100°C. Basic rated dynamic load and static load shall multiply relative temperature factor  $f_r$  individually, as chart below. Accessories are made of plastic or rubber. Recommended environment temperature is under 100°C.

### ◆ Load factor fw

Load of linear rail could be taken by calculation, but calculated value is less than load in actual running with vibration and shock. Considering different running conditions and speed, it's recommended to take experienced load factor divided by basic dynamic load.

Running condition	Speed	fw
Smooth without shock	$V \leq 15\text{m/min}$	1.0 ~ 1.2
Regular shock with vibration	$15 \leq V \leq 60\text{m/min}$	1.2 ~ 1.5
Medium shock with vibration	$60 \leq V \leq 120\text{m/min}$	1.5 ~ 2.0
Hard shock with vibration	$V \geq 120\text{m/min}$	2.0 ~ 3.5

### ◆ Calculation of life hours( $L_h$ )

If stroke length and travel times used in linear rail guides are constant, we could have conversion of life hours( $L_h$ ) with rated life( $L$ ) acquired by above formula.

$L_h$  : life hour (Hr)

$L$  : rated life distance calculation(km)

$I_s$  : stroke length(m)

$n_1$  : travel times per min(min-1)

$$L_h = \frac{L * 10^3}{2 * I_s * n_1 * 60}$$

### ◆ Life of ball screw

Even if in correct usage, it would be unusable due to degeneration after a period.

Period from beginning to disablement is called life of ball screw, generally 2 kinds divided :

(1)Fatigue life : in case of peeling off.

(2)Accuracy life : accuracy degradation caused by abrasion.

### ◆ Fatigue life could be calculated by basic dynamic rated load, same as rolling bearing's.

◆ Basic dynamic rated load  $Ca$  : Dynamic load means same batch of ball screw in same specification runs under common conditions for a million times, and 90% of them without peeling off from screw shafts. This axial load is called dynamic rated load( $Ca$ ). In selection of ball screw , shorter or longer life are inappropriate. The one in longer life is oversized, and not economical. Fatigue life goals to variety purposes of ball screw are shown for reference as list below .

Machine tool..... 20000 hours

Production machinery..... 10000 hours

Automatic control equipment..... 15000 hours

Measure instrument..... 15000 hours

### ◆ Life calculation

Fatigue life could be shown as 3 ways :

a : total rotated numbers    b : total running time    c : total stroke length

$L$  : fatigue life , shown in total rotated numbers

$L_t$  : fatigue life, shown in total running time

$L_s$  : fatigue life, shown in total stroke length

$Ca$  : basic dynamic rated load

$F_a$  : axial load

$n$  : max. speed of motor

$I$  : guide stroke

$fw$  : load factor

$$L = \left\{ \frac{Ca}{F_a * fw} \right\}^3 * 10^6$$

$$L_t = \frac{L}{60 * n}$$

$$L_s = \frac{L * I}{10^6}$$

Load factor fw		
Vibration & shock	Speed (V)	fw
Light	$V < 15\text{ (m/min)}$	1.0 ~ 1.2
Medium	$15 < V < 60\text{ (m/min)}$	1.2 ~ 1.5
Hard	$V > 60\text{ (m/min)}$	1.5 ~ 3.0

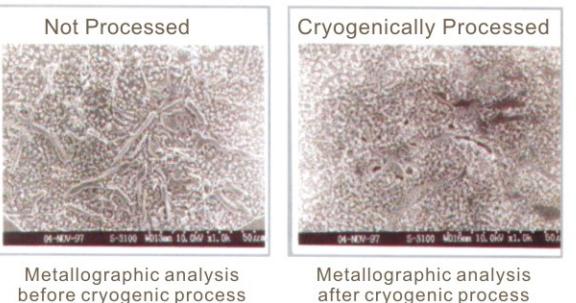

All **GMT XY-TABLE** is well been cryogenic processing.

Cryogenic process is to place the part in the medium with temperature under 196°C, followed step by step progress of new technic to improve material character. Found by relevant search, cryogenic process is not only obviously increase on strength and life of black (colour)metal, plastic and china...etc, but also improve the structure evenly. Increase of dimension stability brings huge economic benefit and promising application in aviation、 aerospace、 optics、 creatures、 chemistry、 machinery, electronic and light industry.

#### ◆ Purpose of cryogenic process

Improving physical character (mechanical character) of metal or other material by progress of subzero processing, to raise usage life, efficiency and quality of parts or workpiece.

Ex: Comparison of metallographic analysis

#### ◆ Benefic analysis of aluminum alloy after cryogenic process:

Improvement during process or in the end of process:

- (1) Deformation of microstructure stress caused by designed material shape.
- (2) Effectively controlling aging deformation.
- (3) After mechanical testing, mechanism strength has been obviously improved, and perfectly perform the desinged mechanism.

Practical application : After dissolving aluminum alloy(Duralumin),have it with cryogenic process and unfrozen immediately. It could not only speed up aging, but reduce most of residual stress at same time to improve mechanical character. Found by another info, aluminum alloy casting with cryogenic process has improvement of processed ability.

Material	Parts	Hardness	Durability	Processing life	Dimension stability	Others
SKH	Drill, Cutting, Tools	+	+	+	+	1 time temper
SKD11	Blanking Die, Punch, Cutting Blade, Roller	+	+	+	+	Avoid broken by grinding
SKD61	Aluminum extrusion die	+	+			
SUJ	Rail, Roll Guide	+	+		+	
Inner parts	Bearing, Gear, Bushing, Cam	+	+		+	Avoid broken by grinding
SUS	Austenite(300)	+	+		+	Improvement of corrosion resistance
	Martensitic(420J2 , 440)	+	+		+	
	Separated(630 , 631)	+	+	+	+	
18Ni 280Grade	18%Ni type 25%Ni type	+	+		+	Speed up sging
Sintering alloy	Cutting tools , Roller , Automobile parts		+	+	+	Speed up sging
Cu alloy	Electrode , Fire gate					Reduce residual stress
AL alloy	Automatic machinery , precision processing , die manufacture , electponic and precision instrument , SMT , PC board soldering device		+		+	Improvement of processed ability
